

Four Major Signs Of A Blocked Drain

A blocked drain in your sink or sewer is never a fun experience. It's also known to be quoted "a nightmare for many homeowners." As water doesn't drain properly, it can lead to further problems not limited to your drainage system. A Blocked drain can show multiple warning signs which can help only before they break down, destroy your pipes and creating havoc.

It Takes Too Long To Drain

It takes a couple of seconds to drain flowing water from the surface of your sink or shower. Bathtubs and toilets should create a whirlpool motion when draining to indicate that it's flowing continuously. If it's not draining like before it's a sign that the blockage is starting to accumulate more debris in the pipeline.

It Starts to Smell

When the drains start to get blocked it can leave a foul smell. Anything stuck in the pipelines can catch debris, food, hair or anything solid. As these remain untreated, they'll start to decompose and spread foul odour back through the pipe openings.

It Makes Strange Noises

The drains can make gurgling sounds, this is not always good though. This can occur in the kitchen sink or shower this is a sign to have your pipes looked at. This sound is due to water flow disruptions, especially when the pressure is high. If water doesn't flow straight down, it creates noise upon hitting whatever is stuck in the pipeline.

If any of these blocked drain signs do occur, don't wait for them to become a serious matter [and call a plumber.](#)
